ABSTRACT

AgriEdge Or-Mange Pvt Ltd is a production organization that requires a reliable way to manage orders, products, inventory and shipment activities. The Salesforce-based Order Management System (OMS) developed for the project centralizes these operations in one Lightning application. The implementation uses custom Salesforce objects, lookup relationships, formula fields, validation rules, user roles and profiles, and programmatic Apex automation.

The implemented data model is centered on AgriEdge Order and AgriEdge OrderItem, supported by AgriEdge Inventory and AgriEdge Shipment. The design provides visibility from an order through its line items, product references, inventory status and shipment tracking. Formula fields calculate line-item totals, discounted order totals and inventory stock status. Validation rules protect critical business conditions, including the requirement for a tracking number before an order is treated as delivered.

The AgriEdge Lightning App provides a single working interface for the business objects and includes Reports and Dashboards in its navigation. The project also demonstrates role-based administration through Sales, Finance, Warehouse and management roles and multiple profiles.

- Calculate order-line and discounted totals automatically with formula fields.

Requirement	Implementation / Evidence
Order processing	AgriEdge Order and AgriEdge OrderItem objects with order status, payment, date and amount fields.
Order line calculation	Total Price formula: $\text{Quantity} \times \text{Unit Price}$.
Discount calculation	Discounted Total formula applies a 10% reduction to Total Amount.
Inventory tracking	AgriEdge Inventory stores Product, Stock Quantity, Reorder Level and Warehouse Location.
Inventory status	Stock Status formula returns Low or Sufficient.
Inventory protection	Inventory_Record_Alert validation rule warns when stock is below reorder level.
Shipment tracking	AgriEdge Shipment stores order, carrier, status and tracking number.
Delivery control	Order_Status_Change_Restriction requires tracking number when the related order is Delivered.
User access	Roles, profiles and users are configured for operational responsibilities.
Application UI	AgriEdge Lightning App with custom object tabs plus Reports and Dashboards.

3. System Architecture and Data Model

The AgriEdge system uses four main custom objects: AgriEdge Order, AgriEdge OrderItem, AgriEdge Inventory and AgriEdge Shipment. An Account is used as the customer. OrderItems connect products to an order. Inventory stores stock information. Shipment stores delivery information.

Main flow: Account → AgriEdge Order → AgriEdge OrderItem → Product. Product → AgriEdge Inventory. AgriEdge Order → AgriEdge Shipment.

Object	Purpose	Important Relationships
AgriEdge Order	Header-level order transaction	Customer → Account; related Shipment
AgriEdge OrderItem	Products/quantities belonging to an order	Order → AgriEdge Order; Product → Product
AgriEdge Inventory	Current stock and warehouse information	Product → Product
AgriEdge Shipment	Fulfillment and tracking information	AgriEdge Order → AgriEdge Order

Logical flow: Customer / Account → AgriEdge Order → AgriEdge OrderItem → Product; Product → AgriEdge Inventory; AgriEdge Order → AgriEdge Shipment.

4. Custom Objects and Field Design

4.1 AgriEdge Order

The AgriEdge Order is the main business record. It stores the customer, order date, order number, order status, payment status, shipping address and total amount.

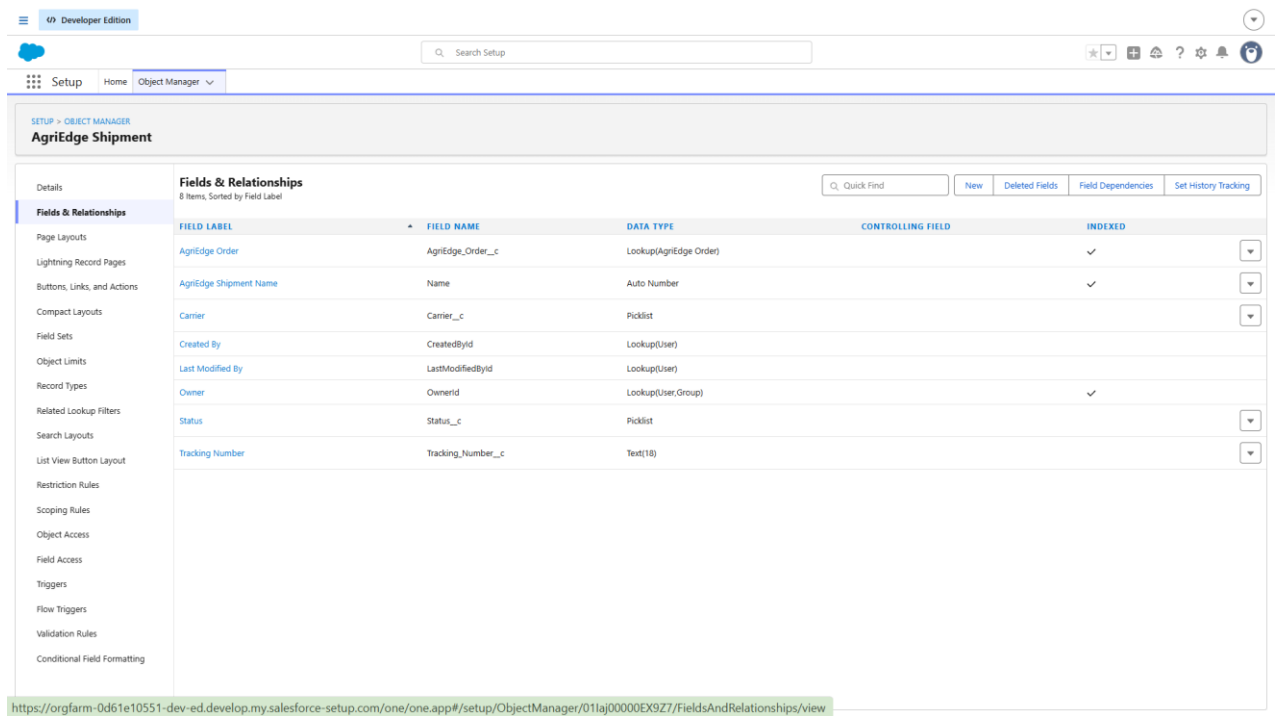

Figure 4.1 — AgriEdge Order: Fields & Relationships

Field	API Name	Type
Customer	Customer__c	Lookup(Account)
Discounted Total	Discounted_Total__c	Formula (Currency)
Order Date	Order_Date__c	Date/Time
Order Number	Order_Number__c	Auto Number
Order Status	Order_Status__c	Picklist
Payment Status	Payment_Status__c	Picklist
Shipping Address	Shipping_Address__c	Text Area(255)
Total Amount	Total_Amount__c	Currency(18,0)

4.2 AgriEdge OrderItem

AgriEdge OrderItem stores each product line in an order. It contains the Order, Product, Quantity, Unit Price and Total Price.

Developer Edition

Figure 4.2 — AgriEdge OrderItem: Fields & Relationships

Field	API Name	Type
Order	Order__c	Lookup(AgriEdge Order)
Product	Product__c	Lookup(Product)
Quantity	Quantity__c	Number(18,0)
Unit Price	Unit_Price__c	Currency(18,0)
Total Price	Total_Price__c	Formula (Currency)

4.3 AgriEdge Inventory

AgriEdge Inventory stores the product, stock quantity, reorder level and warehouse location. Stock Status shows whether stock is Low or Sufficient.

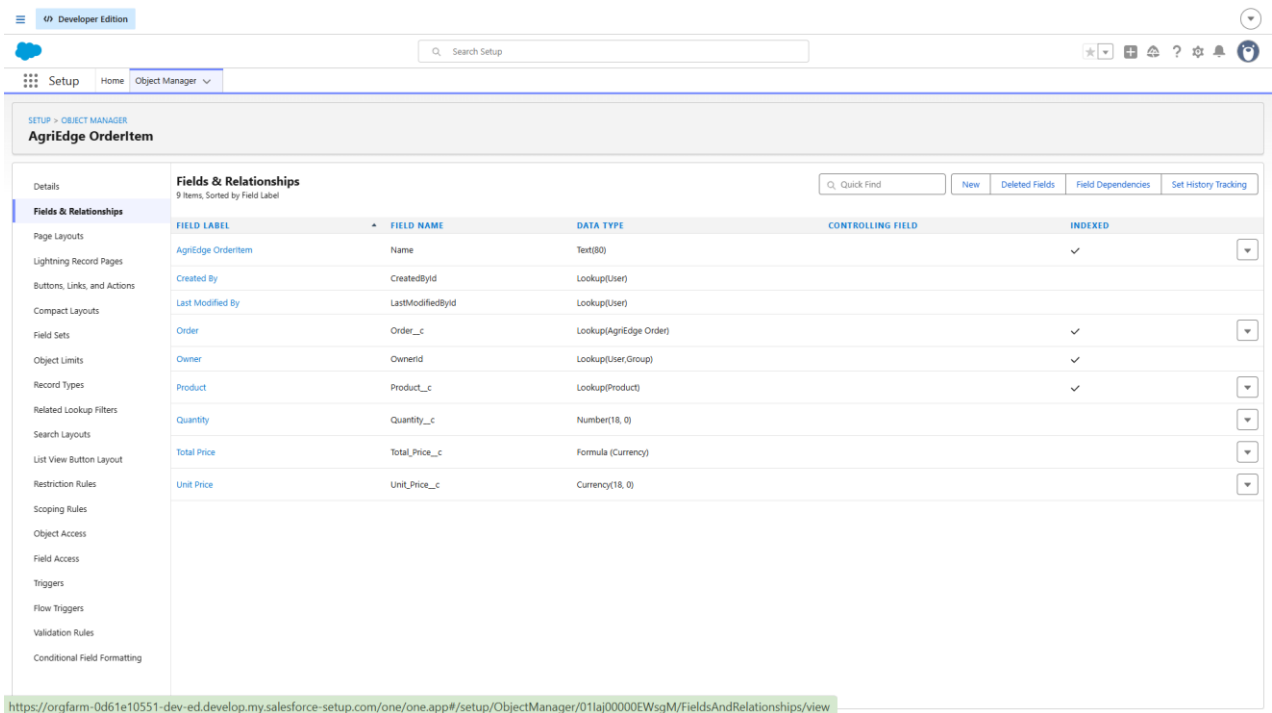

Figure 4.3 — AgriEdge Inventory: Fields & Relationships

Field	API Name	Type
Product	Product__c	Lookup(Product)
Reorder Level	Reorder_Level__c	Number(18,0)
Stock Quantity	Stock_Quantity__c	Number(18,0)
Stock Status	Stock_Status__c	Formula (Text)
Warehouse Location	Warehouse_Location__c	Text(200)

4.4 AgriEdge Shipment

AgriEdge Shipment stores shipment details for an order. It contains the order, carrier, status and tracking number.

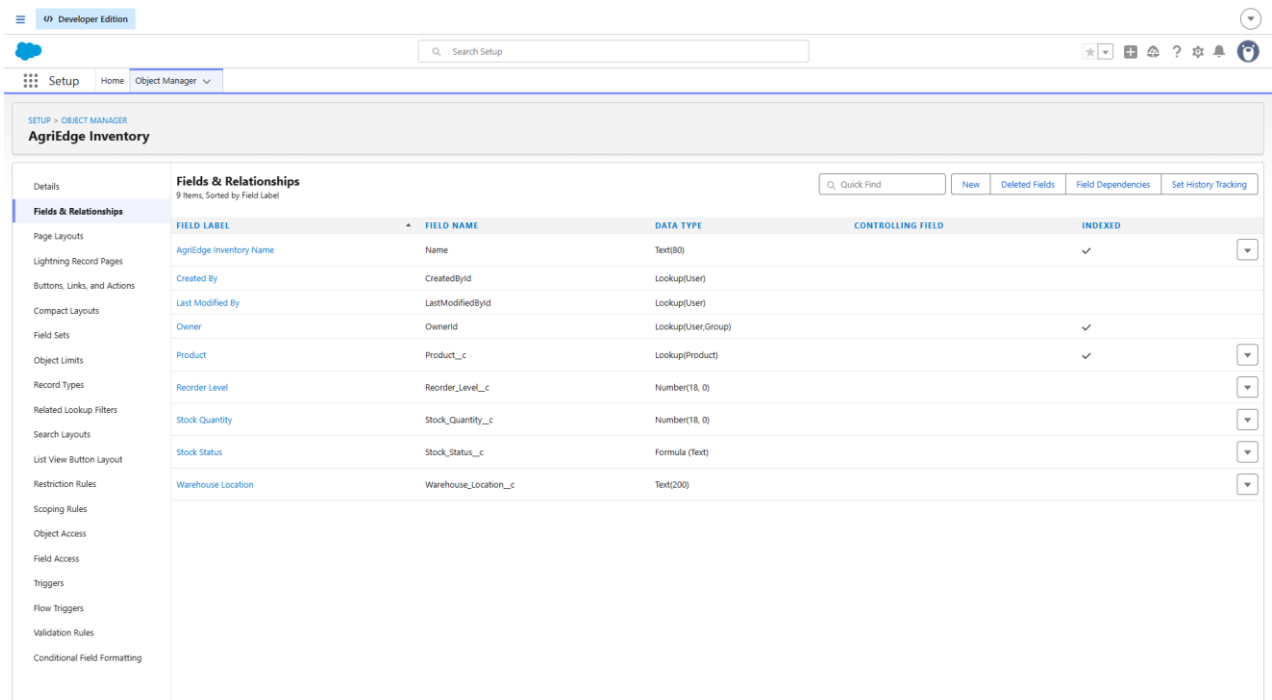

Figure 4.4 — AgriEdge Shipment: Fields & Relationships

Field	API Name	Type
AgriEdge Order	AgriEdge_Order__c	Lookup(AgriEdge Order)
Carrier	Carrier__c	Picklist
Status	Status__c	Picklist
Tracking Number	Tracking_Number__c	Text(18)

5. Formula Fields and Business Rules

5.1 Discounted Total

The Discounted Total field applies a 10% discount to the Total Amount:

Total_Amount__c - (Total_Amount__c * 0.1)

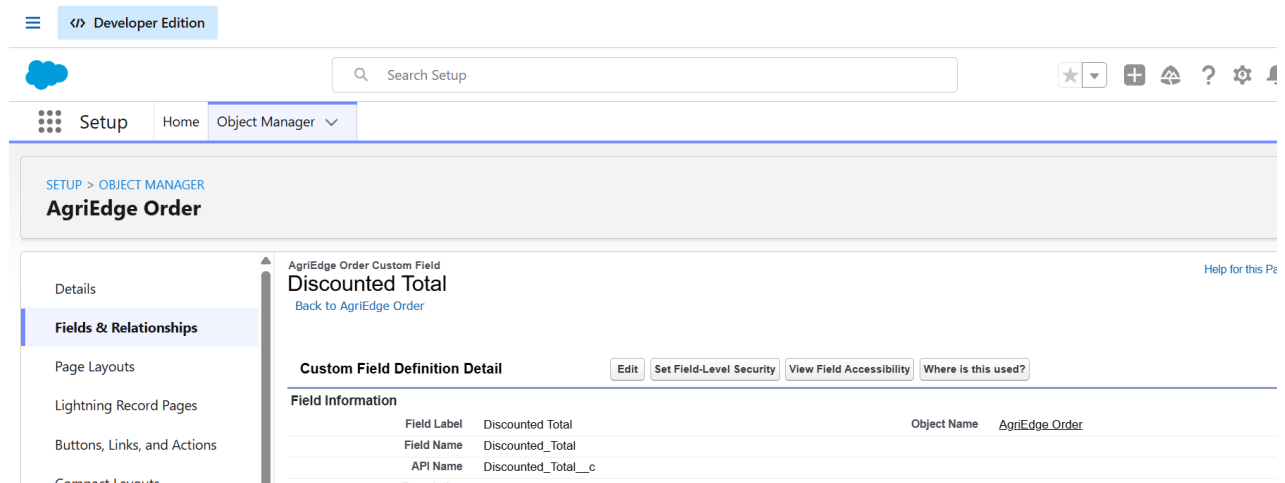

Figure 5.1 — Discounted Total formula configuration

5.2 OrderItem Total Price

The Total Price field calculates Quantity × Unit Price:

Quantity__c * Unit_Price__c

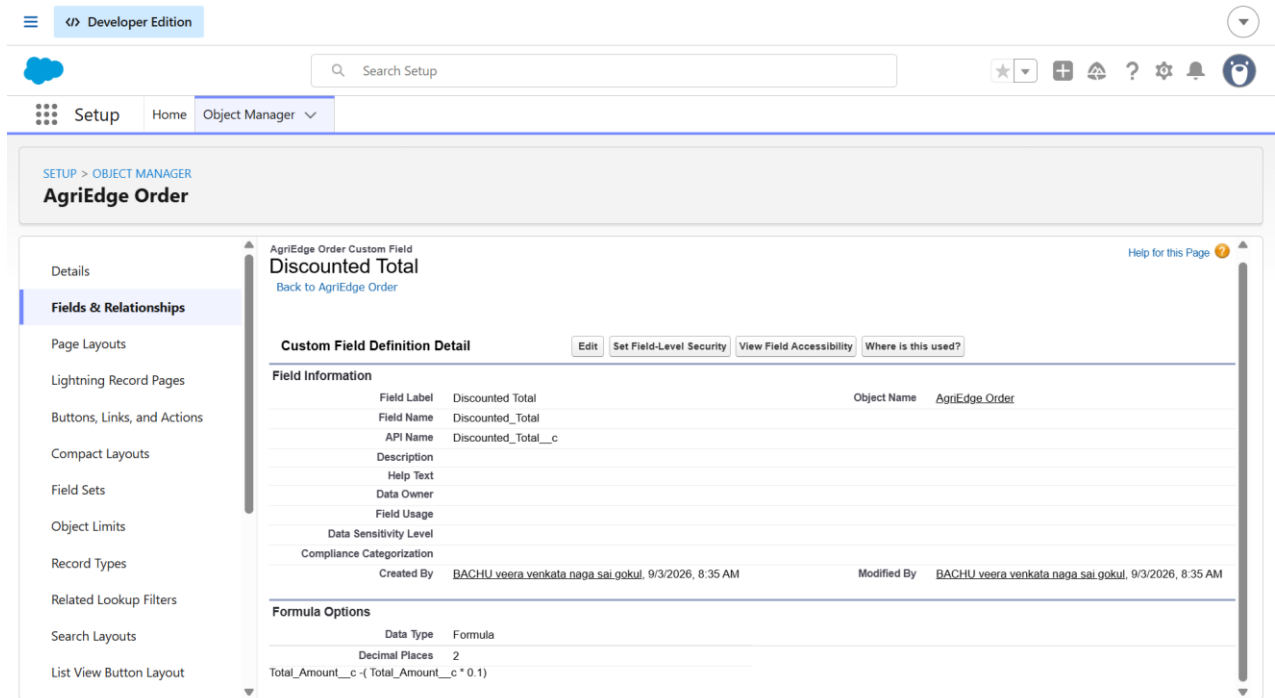

Figure 5.2 — OrderItem Total Price formula

5.3 Inventory Stock Status

The Stock Status field shows Low when Stock Quantity is less than or equal to Reorder Level. Otherwise, it shows Sufficient:

IF(Stock_Quantity__c <= Reorder_Level__c, "Low", "Sufficient")

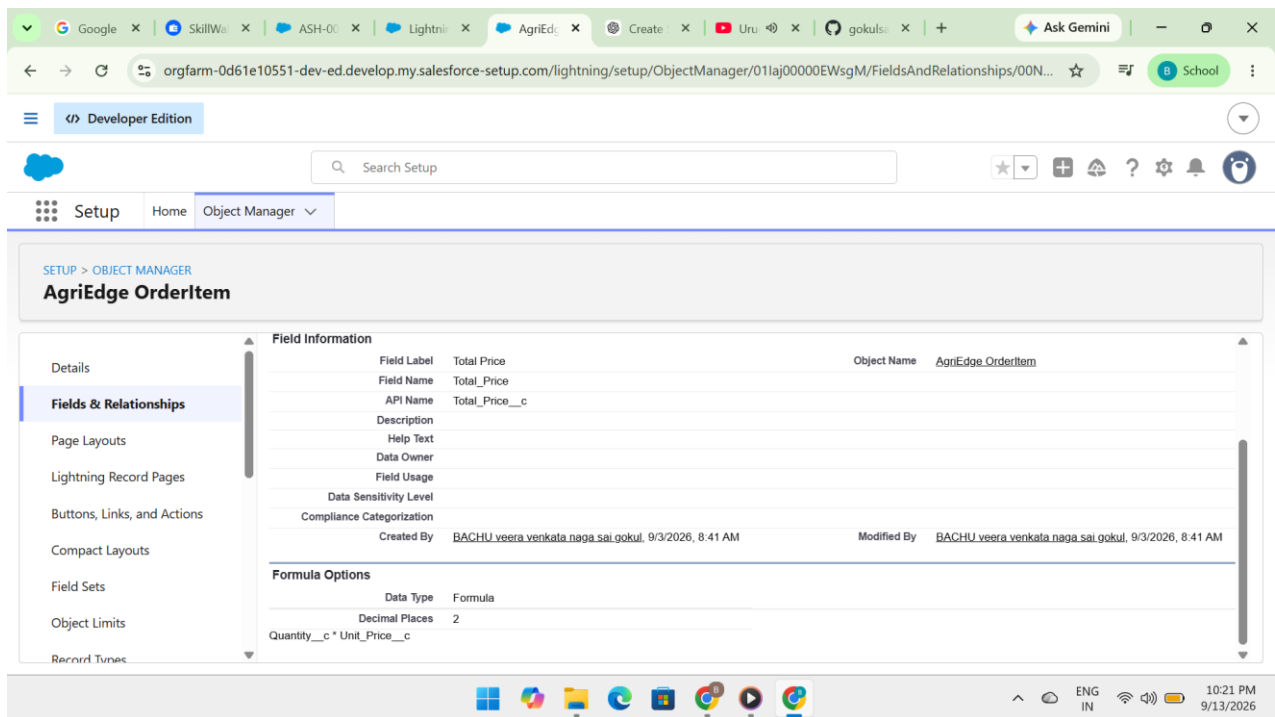

Figure 5.3 — Inventory Stock Status formula

6. Validation Rules

6.1 Inventory Record Alert

The Inventory_Record_Alert rule shows an error when stock is below the reorder level. The message is: “Stock is below reorder level. Please restock.”

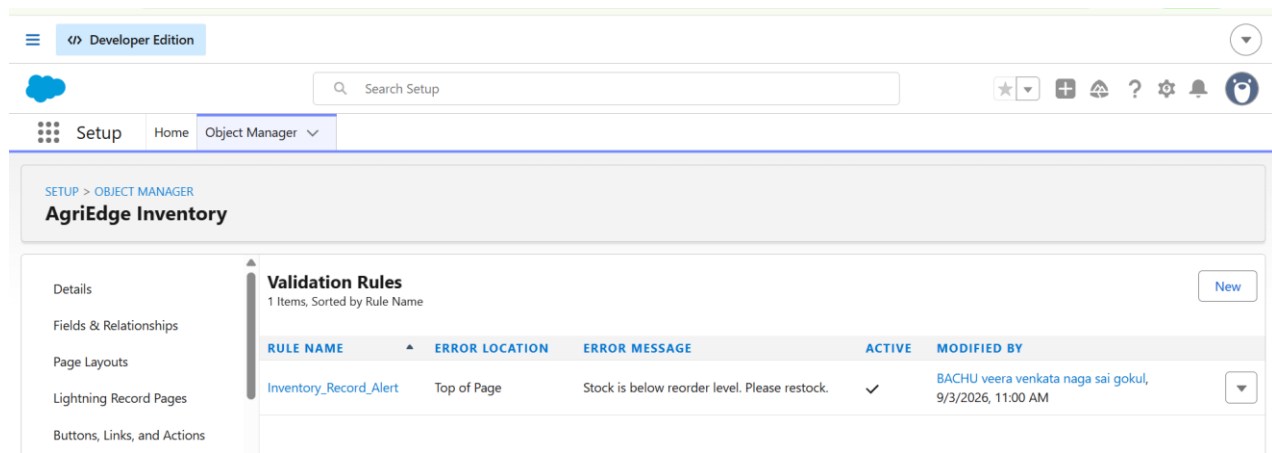

Figure 6.1 — Inventory_Record_Alert validation rule

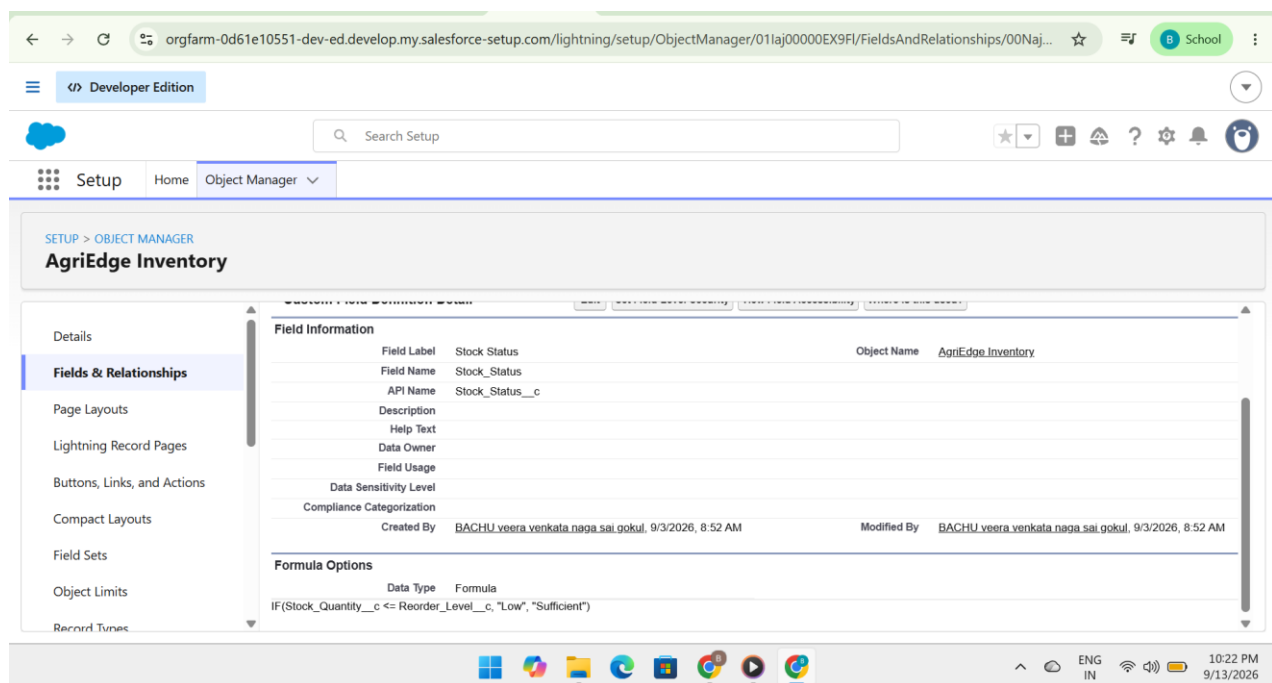

Figure 6.2 — AgriEdge Inventory validation-rule detail

6.2 Order Status Change Restriction

The Order_Status_Change_Restriction rule requires a tracking number before an order can be marked as Delivered. The message is: “Tracking Number is required before marking order as Delivered.”

```
AND(  
  ISPICKVAL(AgriEdge_Order__r.Order_Status__c, "Delivered"),  
  ISBLANK(Tracking_Number__c)  
)
```

Error message: “Tracking Number is required before marking order as Delivered.”

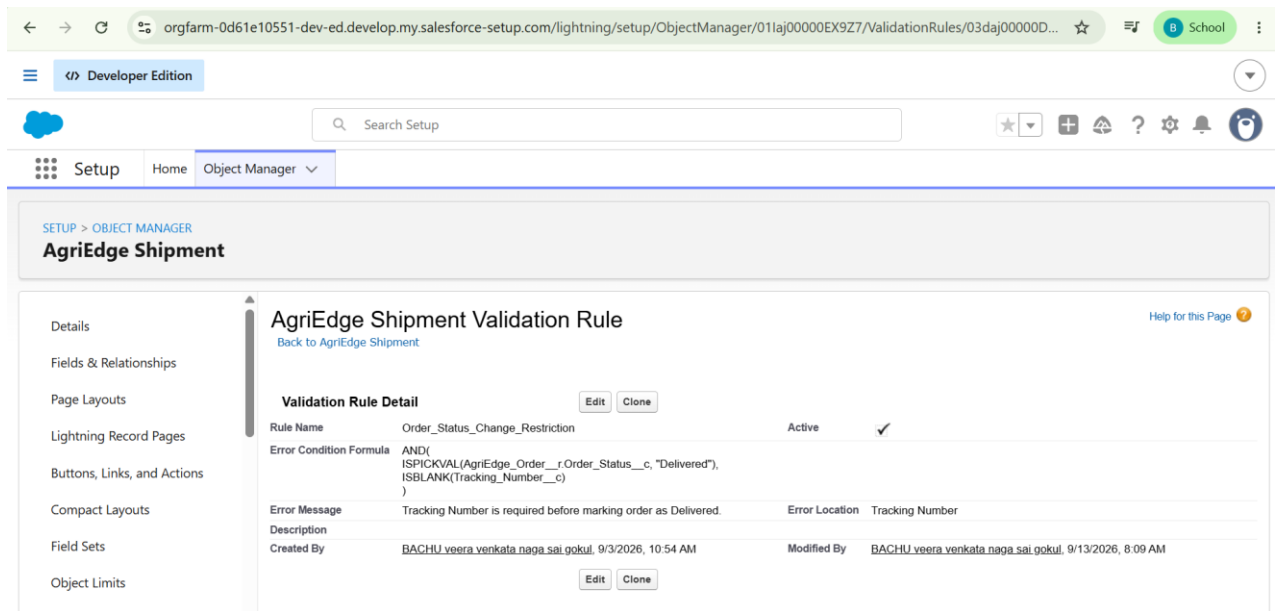

Figure 6.3 — Order_Status_Change_Restriction validation rule

7. Lightning App, Tabs and User Interface

The Lightning App is named AgriEdge. It gives users one place to work with Orders, OrderItems, Inventories and Shipments. Reports and Dashboards are also available. Custom tabs were created for the four main objects.

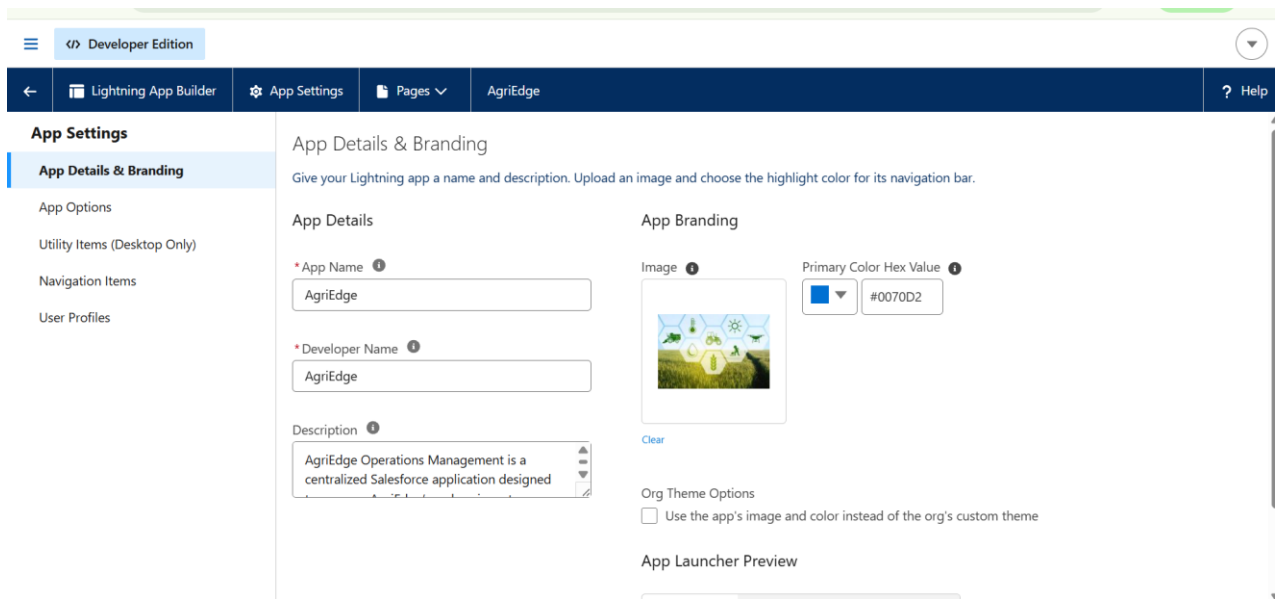

Figure 7.1 — AgriEdge Lightning App: App Details & Branding

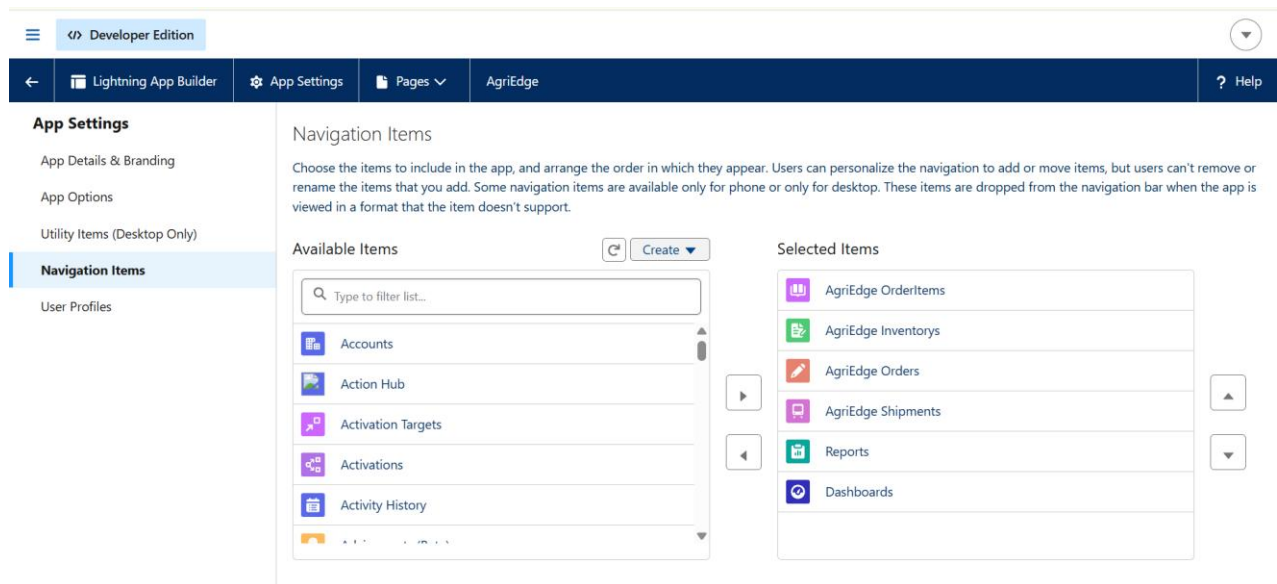

Figure 7.2 — AgriEdge Lightning App: Navigation Items

Custom object tabs were created for AgriEdge Inventories, AgriEdge OrderItems, AgriEdge Orders and AgriEdge Shipments. Reports and Dashboards are also included in the navigation.

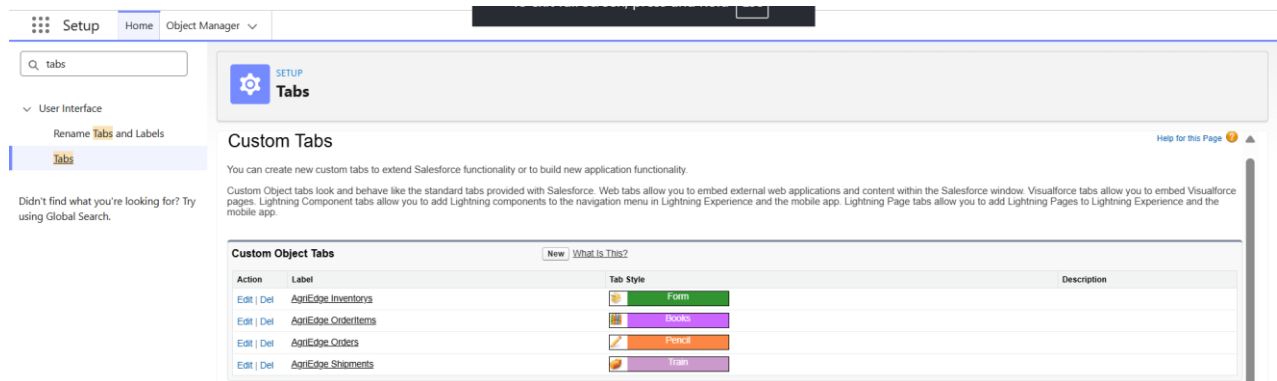

Figure 7.3 — Salesforce Custom Object Tabs

8. Data Security, Profiles, Roles and Users

Salesforce Profiles, Roles and Users are used to control access and responsibilities. The project includes roles such as COO, Sales Representative, Finance Team and Warehouse Manager. Different profiles and users are configured for business and system activities.

The visible role structure includes COO, Sales Representative, Finance Team and Warehouse Manager, along with additional sales, marketing and warehouse roles. Profiles visible in the org include Platform 1, Platform 2, Platform 3, Read Only and System Administrator.

9. Automation and Apex Architecture

Apex is used for actions that need program logic. The project includes classes for order tasks, email processing and shipment processing. A trigger starts the email process when Payment Status changes to Paid. The Apex test class checks the main automation and data behavior.

9.1 Order Task Creation

OrderTaskCreator creates a task for processing a new AgriEdge Order.

9.2 Order Confirmation Email

OrderEmailSender finds Contacts linked to the customer Account and sends the order email to their email addresses. This matches the Business Account and Contact design used in the project.

The separate Apex source-code package accompanies this report so that triggers, classes and test classes can be maintained independently from the written documentation.

Salesforce's current architecture guidance describes Record-Triggered Flow and Apex Triggers as complementary automation tools. Flow is generally preferred for declarative orchestration, while Apex is appropriate for high-density, complex or highly controlled logic. [☐cite☐turn0search4☐](#)

10. End-to-End Real-World Order Scenario

A customer such as Green Valley Farms places an order for seeds or another agricultural product. The order is linked to the Account. OrderItems store the products and quantities. Formula fields calculate prices and the discounted total. Inventory shows the available stock. When payment becomes Paid, the order automation can update the order and create the shipment record. The customer can receive an email through the Contact email address. A tracking number is required before delivery.

The customer is represented through the Account lookup on AgriEdge Order. A new order is created with order date, status, payment status, shipping address and total amount.

An AgriEdge OrderItem is created and linked to the parent order and Product. Quantity and Unit Price are entered.

Total Price is calculated as $\text{Quantity} \times \text{Unit Price}$.

Discounted Total is calculated from Total Amount using the configured 10% discount formula.

The corresponding product inventory record exposes Stock Quantity, Reorder Level, Stock Status and Warehouse Location.

3. Low-Stock Control

When stock is at or below the reorder threshold, Stock Status returns Low and the Inventory_Record_Alert rule communicates that restocking is required.

4. Operational Task

OrderTaskCreator can create a processing task for the order so staff have an explicit work item.

5. Customer Notification

6. Shipment Creation

A shipment record is associated with the order and stores carrier, status and tracking number.

7. Delivery Control

Before an order is considered Delivered, the shipment must contain a tracking number; otherwise the Order_Status_Change_Restriction rule blocks the transaction.

11. Testing and Validation

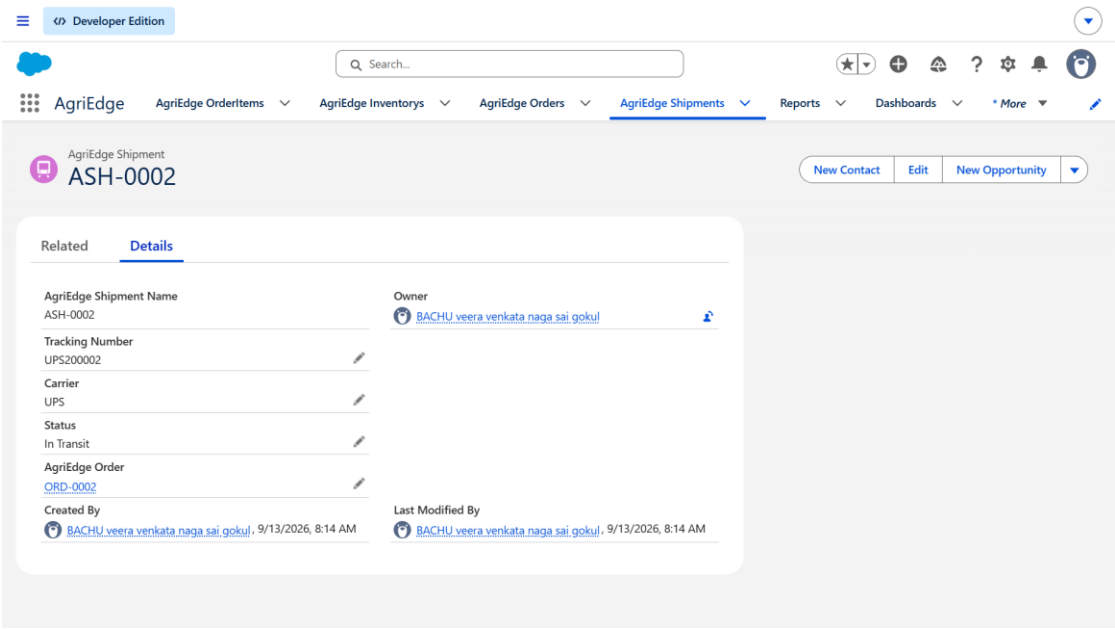

The project was tested using Salesforce records and Apex tests. The screenshots below are examples created during testing.

Test Case	Expected Result
OrderItem Quantity = 2, Unit Price = ₹500	Total Price = ₹1,000
Order Total Amount = ₹10,000	Discounted Total = ₹9,000
Stock Quantity > Reorder Level	Stock Status = Sufficient
Stock Quantity <= Reorder Level	Stock Status = Low
Low stock condition is entered	Inventory validation message requests restocking
Order is Delivered + Tracking Number blank	Save is blocked with tracking-number error
Order is Delivered + Tracking Number populated	Validation condition is satisfied
OrderTaskCreator receives valid Order Ids	Tasks are created in bulk
OrderEmailSender receives orders with customer email	Confirmation messages are prepared and sent

For Apex deployment to a production environment, formal test classes and adequate code coverage are required. The project source package therefore keeps the test class separate from the main report.

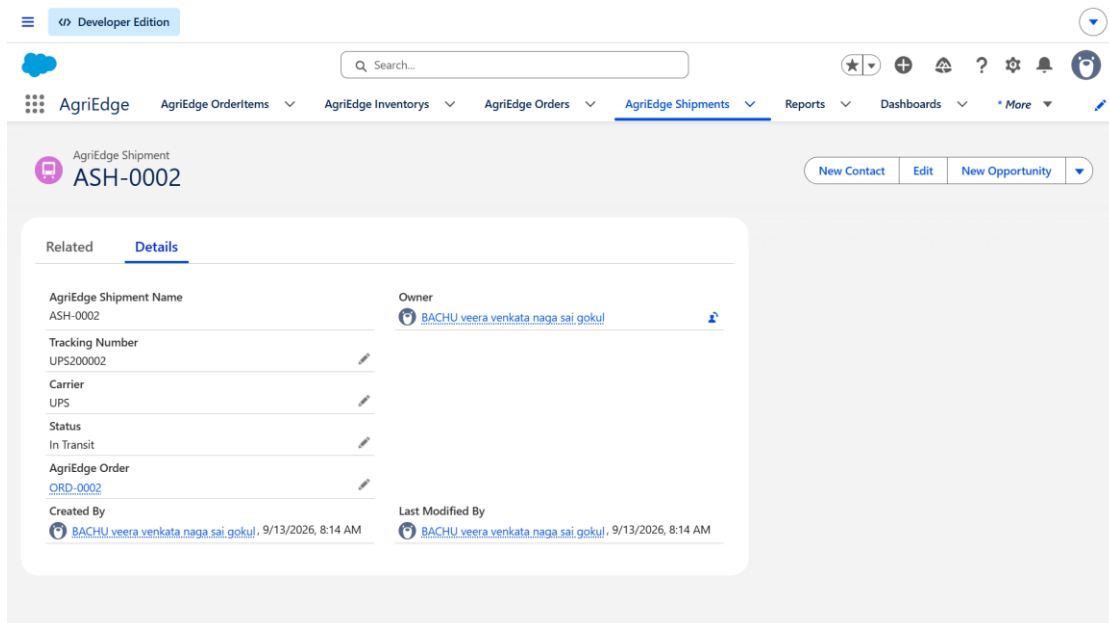

Test Example 6 – Shipment Verification

This screenshot is another test view of the shipment record and its tracking information.

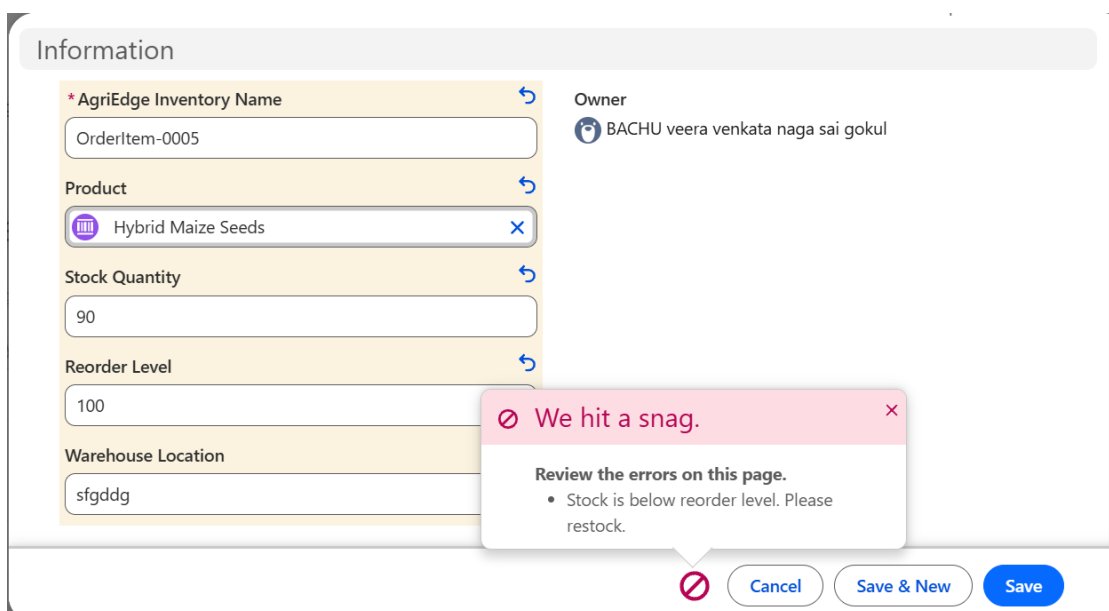

Test Example 5 – Shipment

The Shipment record shows a tracking number, carrier, status and related AgriEdge Order.

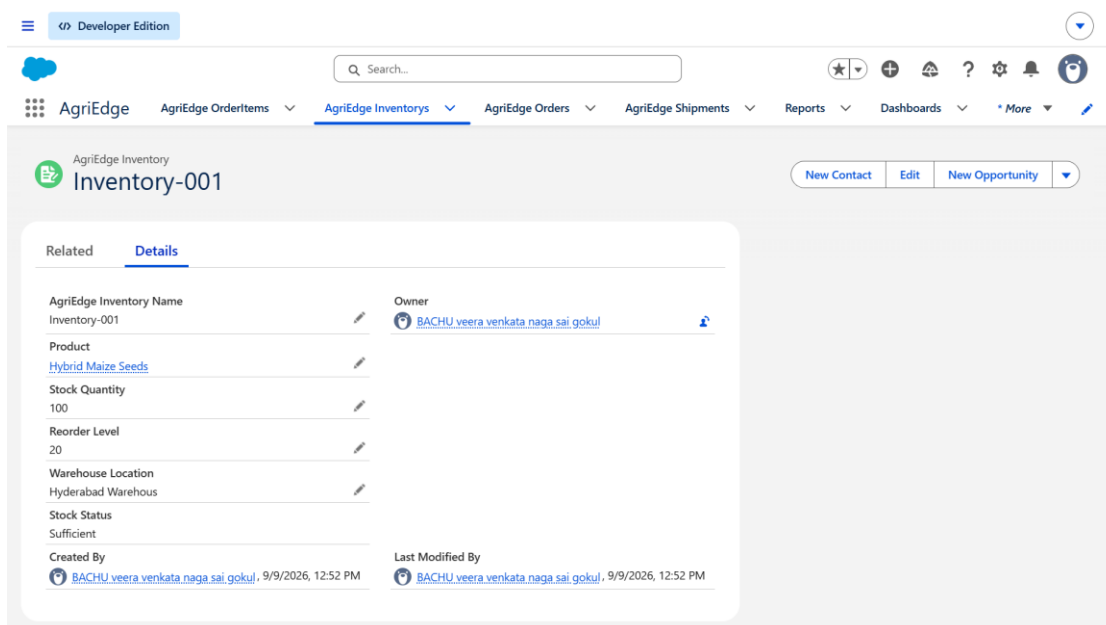

Test Example 4 – Low Stock Validation

The validation rule stops the record when Stock Quantity is below the Reorder Level and displays the restock message.

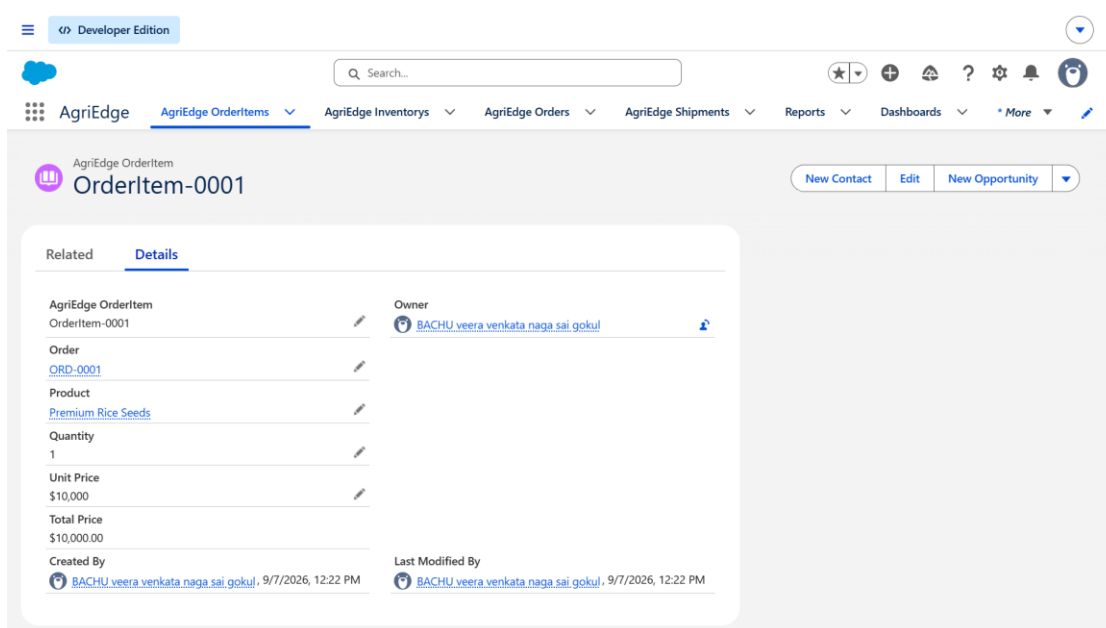

Test Example 3 – Inventory

The Inventory record shows the product, stock quantity, reorder level, warehouse location and Stock Status.

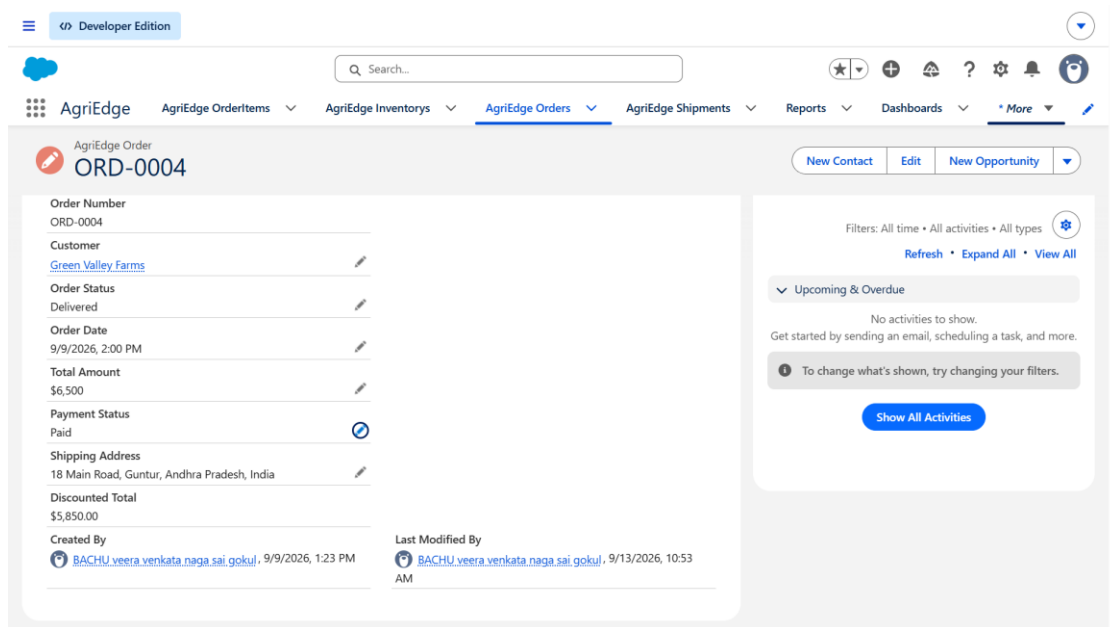

Test Example 2 – Order Item

The OrderItem shows the linked order, product, quantity, unit price and calculated total price.

Test Example 1 – Delivered Order

The order shows Green Valley Farms as the customer, Payment Status as Paid, Order Status as Delivered, and a Discounted Total.

12. Deployment, Maintenance and Monitoring

The project was developed in Salesforce Dev Edition separate from the report. Use Debug Logs when checking automation. Review validation rules when status values change. Run the Apex test class before deployment. For future production use, keep the code in source control.

- Maintain one authoritative copy of each Apex trigger and class in the source-code folder.
- Use Salesforce Setup and Apex Jobs to review asynchronous or scheduled execution where applicable.
- Use Flow run history and Debug Logs when troubleshooting automation.
- Review validation rules whenever order or shipment status values are changed.
- Use a sandbox or source-controlled development workflow for a future production rollout.
- Add automated Apex test coverage before production deployment.

13. Results and Business Benefits

- Reports and Dashboards for analysis.
- Role and profile based access.
- Customer email notifications.
- Better control of delivery information.
- Clear stock and reorder status.
- Automatic price and discount calculations.
- Centralized orders, order items, inventory and shipments.

14. Limitations and Future Scope

- AI-based demand forecasting.

- Stronger security controls.
- Supplier and carrier integrations.
- Automatic stock replenishment.
- More Reports and Dashboards.
- Customer portal for order and shipment tracking.

15. Conclusion

The AgriEdge Salesforce Order Management System provides a simple and organized way to manage agricultural orders. It combines custom objects, formulas, validation rules, user management, Apex automation and reporting. It also provides a good base for future improvements.
